

GKBook

Colors That Start With H

Names, digital swatches, RGB and hex codes, and editorial shade families

935 records	804 displayed names	12 shade families
Source-specific numeric entries	Including labeled variants	Independent editorial judgments

An illustrated, source-linked reference for high school and college students. Includes a complete numeric directory, worked examples, material and cultural context, unresolved-source records, and a companion swatch atlas.

Research checked: October 14, 2026
Language: US English
Scope: Source-bounded international reference; no worldwide completeness claim.

Overview

What are H colors?

H colors are colors whose recorded names begin with the letter H. This is an alphabetical grouping, not a physical category: it includes pale honeydew, vivid hot pink, dark hunter green, and hundreds of named paint shades. A useful color reference identifies not only a name but also its source, code, medium, and the meaning of its numerical values.

This GKBook reference contains **935 source-specific numeric records**, representing **804 distinct displayed names** and **930 different RGB triplets**. The displayed-name count includes explicitly labeled institutional tint and shade variants, but excludes separately noted catalog aliases. Another 56 catalog candidates are documented separately because their consulted sources contain conflicting numbers or provide no numeric values. Traditional pigments, cultural color terms, and selected material standards are also explained without assigning invented universal hex codes.

The directory combines manufacturer previews, two standardized CSS keywords, an X11 dataset, institutional palettes, survey labels, and clearly marked dealer approximations. Its 12 shade families are GKBook editorial judgments of the displayed swatches. They are navigation aids, not corrections to a manufacturer’s paint formulation or official classification.

The scope is deliberately broad but bounded. There is no authoritative worldwide inventory of every H color name, and new names can be coined at any time. This article therefore makes no claim to be the world’s largest, best, or complete list. Its value lies in traceable entries, consistent treatment, and an explicit record of limitations.

At a glance

Measure	This edition
Numeric records	935
Distinct displayed names	804, including institutional variant labels
Distinct RGB triplets	930
Source groups	16 (including seven paint manufacturers)
Unresolved catalog candidates	56; excluded from numeric totals
Contextual terms and product-name discussions	14; some names overlap the numeric directory

Reading a color record

Name, source, and code work together

A marketing name is not a universal coordinate. Different companies can use the same name for different colors, while one company can publish aliases or several catalog identifiers. In the directory, the source and its code identify the record; the H-number is only GKBook's reference ID for this edition. Source labels are clickable citations to the page or dataset consulted. Full URLs are also preserved in the companion CSV and JSON.

Source spellings, including Gray and Grey, are retained in names. The article's prose uses US English. Entries are alphabetized without regard to case, spaces, punctuation, or accents, then ordered by source and code. The brand name is not treated as part of the alphabetical color name: Resene Half Alabaster is filed under Half Alabaster. Names such as Dark Heliotrope would belong under D unless the source separately names a color Heliotrope.

Each numeric record supplies a swatch, RGB triplet, six-digit hexadecimal code, GKBook family, and a brief use or provenance note. Where available, the note also preserves the source's family and its light reflectance value (LRV). A missing family or LRV means it was not supplied or reliably extracted from that source; it is not a measured zero.

What the evidence labels mean

Manufacturer pages document the maker's current published screen preview, not a laboratory match to a physical sample. CSS records have a standards-defined sRGB meaning. X11 entries are software dataset definitions. Institutional records apply to the cited organization or unit. xkcd records report survey-derived screen labels. Pantone-labeled dealer rows are explicitly third-party approximations; current licensed Pantone numeric specifications were not verified. The COLORBOND Headland entry is a supplier preview hosted by Resene, not an independently verified current COLORBOND specification. [2-16]

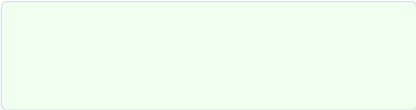

An **archived-source flag** is preserved for 93 entries: 91 from Behr and two from Sherwin-Williams. This records the consulted metadata, not a claim that a color can or cannot still be mixed or purchased. Likewise, the date checked is the research date, not the date when a name was invented. Individual product availability was outside the scope.

GKBOOK / H-COLORS / FIGURE 2

Why a color name needs its source

All values are the cited digital previews; they are not physical equivalence claims.

Figure 2. Why a color name needs its source The same or related name can identify different published values. Harvard’s two crimson records are retained under their respective institutional contexts. The Pantone-labeled Heliotrope is a dealer approximation.

Understanding RGB, hex, and physical color

RGB is a coordinate system for colored light

An RGB triplet gives red, green, and blue component values. In the eight-bit notation used here, each component is an integer from 0 to 255. The three channels yield $256 \times 256 \times 256 = 16,777,216$ possible encoded combinations. This is a count of codes, not a count of all colors people can distinguish or all colors found in nature. [12,17]

A color space supplies the context needed to interpret those numbers. **sRGB** specifies primaries, a reference white, and a nonlinear relationship between encoded values and light. CSS named colors are defined in sRGB. This publication renders all directory values as sRGB for consistent comparison; where a maker does not identify its encoding, that is a working assumption for its website preview, not a verified measurement of its paint. [12,17]

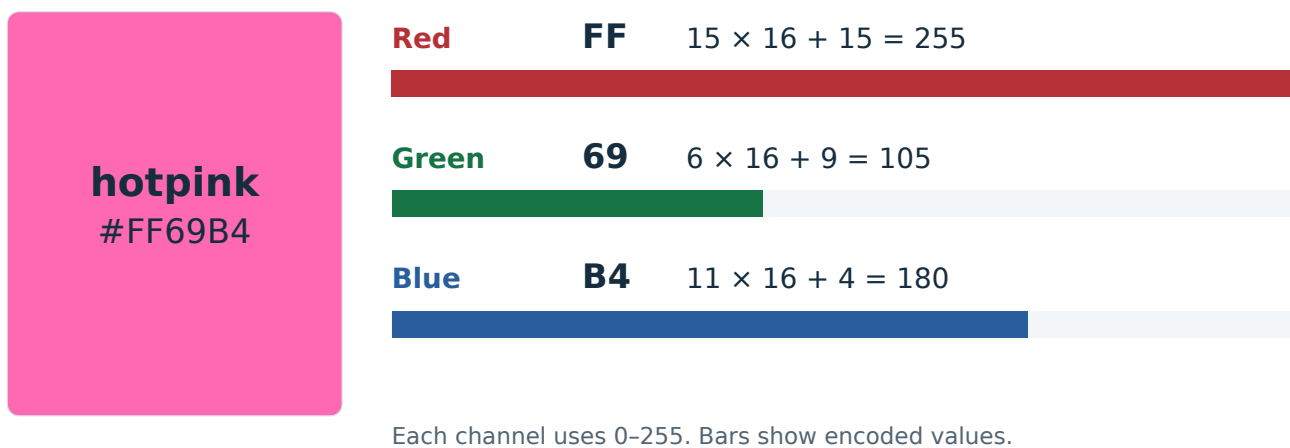

Worked example: reading #FF69B4

A six-digit hex code has three pairs: **#RR GG BB**. Hexadecimal is base 16: digits 0–9 are followed by A–F for values 10–15. For CSS **hotpink**, FF = $15 \times 16 + 15 = 255$; 69 = $6 \times 16 + 9 = 105$; and B4 = $11 \times 16 + 4 = 180$. Thus #FF69B4 and RGB (255, 105, 180) encode the same color. Letter case does not change a hex value. **Figure 1** shows the conversion. [12]

GKBOOK / H-COLORS / FIGURE 1

Reading a six-digit hex color

CSS hotpink • #FF69B4 • RGB (255, 105, 180)

Original graphic for GKBook • Values checked October 14, 2026

Figure 1. Reading a six-digit hex color The three hexadecimal pairs encode the red, green, and blue channels of CSS hotpink. Bar lengths show code values, not linear light or paint proportions.

The paired representations also provide a useful error check. If a source says RGB (236, 139, 51), its six-digit hex equivalent must be #EC8B33. A printed #EC8B34 instead specifies a blue component of 52. Both may look nearly identical, but they cannot be the same numerical record. The unresolved appendix preserves this exact disagreement for Resene Hero instead of guessing which field the maker intended.

Why a screen is not a paint sample

Color appearance depends on the light reaching the eye and on visual context. A monitor emits light; a painted surface changes the spectrum of the light it reflects. Two objects can look alike in one illumination without having identical spectra. Background, lighting, material, gloss, and viewing conditions can therefore change a comparison. Brown itself is strongly dependent on its relationship to brighter surroundings. [\[36\]](#)

A digital swatch cannot reproduce every material effect: metallic sparkle, fluorescence, texture, transparency, and changes with viewing angle require more information than one flat RGB triplet. Use these swatches to study names and compare published previews. For a physical specification, consult the relevant maker's sample or licensed standard in the intended setting. A shared hex value does not establish that two paints use the same pigments or match under every light. [\[7,9,17\]](#)

Names, shades, and GKBook's 12 families

A practical classification, not a universal taxonomy

In everyday language, shade can mean almost any variation of a color. In a common art teaching convention, a tint is lightened with white, a shade is darkened with black, and a tone is modified with gray. Those words are not guaranteed formulas in product names. This article uses **family** for its broad classification and preserves source labels such as Half, Light, Deep, and tint when they identify actual catalog variants. [39]

The editorial families are Black, Blue, Brown, Gray, Green, Orange, Pink, Purple, Red, Violet, White, and Yellow. Classification considers the visible hue, apparent lightness, and strength of color together. Computer grouping was followed by visual review of every included swatch. **GKBook's independent visual judgment governs the final family, including when sources disagree.** Source voting does not determine it. Identical RGB values receive the same family throughout this edition. Borderline cases remain judgments; a different observer or viewing setup can reasonably favor a neighboring family.

For this directory, Purple generally covers red-leaning and magenta-leaning purples; Violet generally covers comparatively blue-leaning purples and lavenders. These are editorial subdivisions of screen appearances. Calling a swatch Violet does not establish that it represents one spectral wavelength. Brown includes many tans, beiges, and taupes; Gray includes near-neutral colors with weak undertones; White includes very pale near-neutral and selected cream appearances. Distinctly chromatic pastels can remain Blue, Green, Pink, or Yellow.

Teal and turquoise are distributed between Blue and Green according to the rendered appearance. Olive can fall in Green, Yellow, or Brown. A grayish lavender may fall in Gray, Violet, or Purple. Such boundaries do not invalidate the original name. Farrow & Ball Hardwick White, for example, is filed as Gray in this edition because of its displayed swatch, while the word White remains in its authentic product name. [9]

When the source family differs

Sherwin-Williams places Half-Caff in Orange; GKBook places its #604C3D preview in Brown. Sherwin-Williams High Strung is cataloged in Green but is assigned Yellow here. Behr Honied White is cataloged in White and assigned Yellow; Behr Hot Pink is cataloged in Red and assigned Pink. **Figure 4** shows these comparisons. Source labels are retained as evidence, and the independent editorial decision is explicit. [2,4]

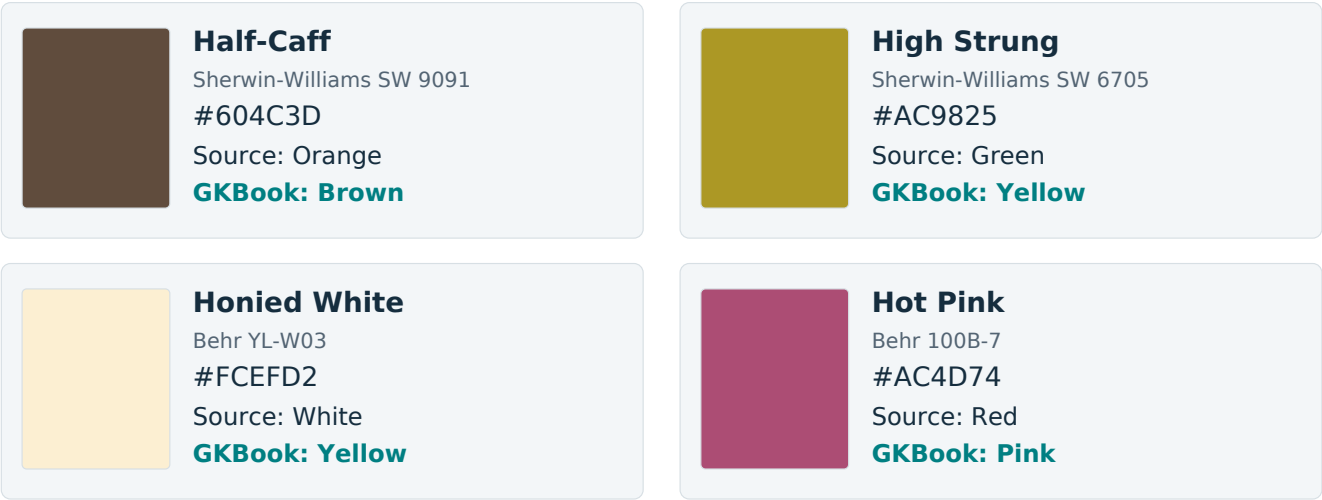

Why “Half” does not mean half an RGB value

There are 185 included names beginning with Half. Most belong to Resene's named variants. Resene explains that test-pot approximations of reduced-strength colors depend on the base and formulation. A label such as Half therefore does not instruct a reader to divide each RGB channel by two, and the article does not synthesize unlisted variants. Halving encoded RGB values would usually darken a screen color; it is not a model of reducing tint strength in a white-based paint. [7,33]

GKBOOK / H-COLORS / FIGURE 4

Source categories and editorial judgments

The name and code stay fixed. Only the navigation family is independently judged.

Original graphic for GKBook • Values checked October 14, 2026

Figure 4. Source categories and editorial judgments Source families and GKBook families serve different organizational purposes. The editorial family is based on the shown digital preview and does not alter the manufacturer’s specification.

Using colors accessibly

Color names are not contrast tests

A vivid color may still provide weak text contrast. For ordinary text, WCAG 2.2's minimum contrast criterion is generally 4.5:1; qualifying large text generally requires 3:1, with specified exceptions. The directory reports the stronger of pure black and pure white text against each opaque sRGB swatch. This is a limited numerical aid, not a complete accessibility assessment. [18]

Worked example: text on hotpink

Normalize each eight-bit channel by dividing by 255. For a normalized encoded channel c , use $c/12.92$ when $c \leq 0.04045$; otherwise use $((c + 0.055)/1.055)^{2.4}$. These operations produce linear-light components R , G , and B . Relative luminance is $Y = 0.2126R + 0.7152G + 0.0722B$. Contrast is $(Y_{\text{lighter}} + 0.05)/(Y_{\text{darker}} + 0.05)$. [38]

For #FF69B4, the normalized channels are approximately (1.0000, 0.4118, 0.7059), and the linear components are (1.0000, 0.1413, 0.4564). This gives $Y \approx 0.3466$. Black text produces $(0.3466 + 0.05)/0.05 \approx 7.93:1$; white text produces $1.05/(0.3466 + 0.05) \approx 2.65:1$. Under this calculation, black meets the normal-text threshold and white does not. Comparisons use unrounded values; printed ratios are rounded for readability.

LRV is a different field

A paint's **light reflectance value** describes the percentage of visible light reflected under specified measurement conditions on a nominal 0–100 scale. It is published here as supplied by the maker. The screen luminance Y calculated from a website preview is not a replacement for that material measurement, and multiplying Y by 100 does not turn it into a verified paint LRV. [37]

Do not convey meaning through color alone. Keep names, IDs, and values visible, add labels to charts, and check the final background, font size, weight, and any transparency. The downloadable graphics include textual labels and alternative text. The HTML companion supplies a text-based version of the article and directory; the PDF is searchable and bookmarked but is not claimed to be a fully tagged accessible PDF.

Source coverage and family guide

Included names begin with H after separating the supplier's brand label. The list includes documented product variants and archived records; it does not generate every imaginable "half," "hot," "heather," or "honey" combination.

One numeric record normally means one named source/code combination. Exact duplicates are removed. Same-name entries from different sources remain separate. X11 spelling and same-value aliases are consolidated within that dataset. Resene Hint Of Grey (Sea Fog) is cross-referenced under Hint Of Grey, and Hopskotch under Hopbush: each pair has the same published source code and digital value. Their original alias URLs are retained in the JSON companion. Virginia Tech variant labels are appended to the base name Hokie Stone for display; those combined labels are not asserted to be separately registered names.

The inventory was built systematically from Behr's published index, Benjamin Moore's family data, Sherwin-Williams downloadable tables, Dunn-Edwards CAD color books, all nine pages of Resene's H index, and PPG's sitemap, followed by checks of individual source pages. Farrow & Ball coverage is a selected set of nine accessible H product pages; it is not claimed to exhaust its historic or international catalogs.

CSS and X11 coverage is bounded by the specific consulted tables/releases. Paint and institutional websites can change, contain legacy entries, or expose incomplete catalogs. English names and the consulted regional sites determine inclusion; translations and alternate regional inventories were not systematically enumerated.

Name/code/value checks within a maker's own catalog verify attribution, not independent physical color accuracy. Multiple websites copying the same RGB list are not independent confirmation. The 57 TCX and five TPG records are dealer approximations. A public TCX transcription agreed with 56 of the 57 TCX hex values but was not treated as independent authentication; Hint of Mint differs between those transcriptions.

No physical samples were measured and no display was certified as a colorimetric reference. Source LRV figures are reported, not remeasured. Metadata flags do not establish present-day purchasing availability. Screen-family judgments do not override the official name, formulation, standard, or source category.

The supplied G-colors PDF was reviewed as a structural and editorial model: source-specific records, 12 families, swatches, code columns, and explanatory appendices. H entries were researched independently. Its older counts and G-specific facts were not carried into this list. [\[1\]](#)

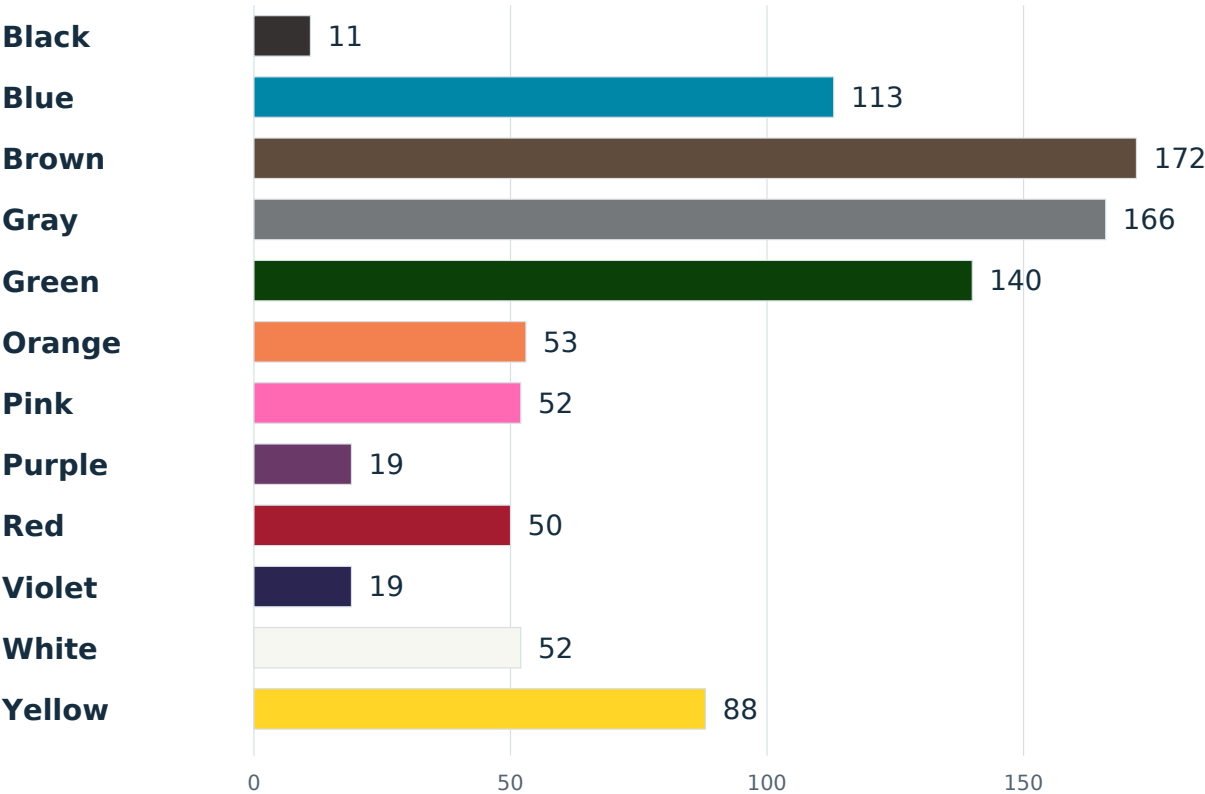

Numeric records by source

Source group	Records	Evidence context
Resene	291	Nine-page H index and individual previews
Behr	165	Maker index and individual pages
Benjamin Moore	133	Maker family data and individual pages
PPG	103	Sitemap and individual pages
Dunn-Edwards	70	2025 CAD books and individual pages
Sherwin-Williams	60	Maker tables and individual pages
Pantone TCX / dealer	57	Dealer approximations only
Virginia Tech	18	18 consistent extended-palette variants
xkcd survey	10	Published survey label dataset
Farrow & Ball	9	Nine selected maker base swatches
X11 / X.Org	9	rgb.txt 1.1.1; aliases combined
Pantone TPG / dealer	5	Five internally consistent dealer rows
CSS Color	2	Two standard sRGB keywords
COLORBOND via Resene	1	One supplier preview; maker standard unverified
Harvard Business School	1	One institutional context
Harvard SEAS	1	One institutional context

The 12 editorial families

Number of numeric records in this edition • n = 935

Counts are source-dependent; each record is counted once. • GKBook, October 14, 2026

Figure 3. The 12 editorial families Counts are based on the included source-specific records after visual editorial review. A name appearing under two sources contributes two records. These bars do not measure cultural preference, usage frequency, or natural abundance.

Family navigation and supplementary figures

Family	Records	Interpretation / atlas reference
Black	11	Very dark near-neutral appearances. Supplementary Figure 5.
Blue	113	Blues, cyan-leaning blues, and selected blue teals. Supplementary Figure 6.
Brown	172	Browns, many tans, beiges, taupes, and earthy warm colors. Supplementary Figure 7.
Gray	166	Near-neutral appearances with weak warm or cool undertones. Supplementary Figure 8.
Green	140	Greens, selected olives, mint tones, and green-leaning teals. Supplementary Figure 9.
Orange	53	Oranges, selected peaches, and warm amber appearances. Supplementary Figure 10.
Pink	52	Pinks, roses, blushes, and selected bright magenta-pinks. Supplementary Figure 11.
Purple	19	Generally red- or magenta-leaning purple appearances. Supplementary Figure 12.
Red	50	Reds, burgundies, and selected brick or crimson colors. Supplementary Figure 13.
Violet	19	Generally blue-leaning purples and lavenders. Supplementary Figure 14.
White	52	Very pale near-neutrals and selected creams or tinted whites. Supplementary Figure 15.
Yellow	88	Yellows, golden tones, and selected yellow-green or cream colors. Supplementary Figure 16.

Figures 5-16 are supplied as the separate GKBook-H-Colors-Atlas.pdf and as numbered SVG and PNG sheets. Together they show every one of the 935 numeric records once. Figures may span several sheets; the sheet number is printed on each graphic.

Alphabetical directory

935 numeric records • Every source label is a citation. The swatch and hex code are the same eight-bit RGB value. Family is GKBook’s judgment. “Screen” notes compare pure black or white text against an opaque sRGB background. Source-family and LRV fields retain the publisher’s meaning.

The directory does not label dealer values as verified Pantone standards. Archived-source flags are retained, and source spelling is preserved. Same-value X11 aliases and two same-code Resene catalog aliases are stated in the notes.

Record category	How to read it
Maker preview	Published digital value; physical appearance can differ.
Standard / dataset	Exact for the cited specification or dataset context.
Institutional	Apply only in the specified unit and palette.
Dealer / supplier preview	Attribution verified at the cited intermediary; current maker standard unverified.

Material names and cultural context

The following 14 discussions verify useful names or concepts without pretending that each has one universal RGB value. They are not additional numeric swatches, and some names overlap the directory. Descriptions such as Blue or Green below are general contextual descriptors, not a new measurement of a physical sample.

Haint blue

Cultural color term. Blue to blue-green; no single standard.

Associated with Gullah cultural traditions. A Smithsonian account describes its use in a contemporary installation and the traditional belief that it wards off spirits. The belief is cultural history, not evidence of a physical protective effect. No universal hex code was established. [27]

Han blue

Historical synthetic pigment. Blue; composition-specific material.

A barium copper silicate, $\text{BaCuSi}_4\text{O}_{10}$, identified in ancient Chinese materials. It is chemically distinct from Han purple. A chemical identity does not determine a single screen code for every preparation, binder, surface, and illumination. [19,20]

Han purple

Historical synthetic pigment. Purple; composition-specific material.

A barium copper silicate, $\text{BaCuSi}_2\text{O}_6$. The consulted research abstract describes it on early Chinese objects, sometimes mixed with the blue compound. The name is a pigment designation, not a licensed digital color standard. [19,20]

Hansa yellow

Pigment family and trade-derived name. Yellow; light, medium, and deep forms vary.

A name used for a group of synthetic organic monoazo or arylide yellows. Products sold under Hansa labels can use different Colour Index pigments, including PY1, PY3, PY74, and PY97. Lightfastness and behavior should be checked for the specific pigment and formulation; they should not be inferred from the family name alone. [21]

Harlequin

Language and catalog term. Context-dependent; no single general value.

In dictionary usage, harlequin can describe something multicolored, often with a diamond pattern. Particular catalogs may nevertheless assign the name to a single swatch: the numeric directory includes Resene Harlequin and Benjamin Moore Harlequin Blue. A widely repeated internet hex value does not by itself establish a universal historical definition. [32]

Harvest Gold — Crayola

Product color name. Named colored pencil; numeric preview unverified.

Appears on Crayola's 100 Pencil Color Chart, page 1. That worksheet is intended to be colored by the user and supplies no RGB or hex value. It verifies the product name, not a numerical match to the paint and textile records named Harvest Gold elsewhere in this article. [30]

Heather violet — RAL 4003

Material color standard. Official English RAL CLASSIC name.

RAL directly identifies code 4003 as Heather violet. The consulted page verifies the name and code. No current licensed RGB conversion was independently established for this edition, so a borrowed "universal" hex value is not assigned. [26]

Heat Wave — Crayola

Product color name. Named colored pencil; numeric preview unverified.

Appears on Crayola's 100 Pencil Color Chart, page 1. Its presence is verified, but the worksheet contains no colored reference swatch or digital coordinates. Numeric values circulating on other websites were not adopted as official Crayola specifications. [30]

Henna

Plant dye and color term. Commonly reddish orange to brown.

The dye is obtained from leaves of *Lawsonia inermis*; lawsone is its principal colorant. "Henna" can refer to the material, a resulting coloration, or a marketing name. The Pantone-labeled dealer record named Henna in the numeric directory is one specified preview, not the universal appearance or composition of natural henna. [24]

Honey yellow — RAL 1005

Material color standard. Official English RAL CLASSIC name.

RAL directly identifies code 1005 as Honey yellow. This verifies a material-standard name and code, not a freely interchangeable hex specification. A separate Pantone-labeled Honey Yellow preview is included under its own source and code. [25]

Honolulu Blue

Team identity and historical color name. Detroit Lions blue; specification and period matter.

The Detroit Historical Society documents the Lions' use of blue in Detroit from 1934 and notes that its appearance has evolved and that origin stories differ. The team's 2024 uniform announcement describes a revised Honolulu Blue. No current official universal RGB value was verified here. Benjamin Moore's unrelated paint named Honolulu Blue remains a separate numeric record. [28,29]

Hooker's green

Artists' color name. Green; historical and modern mixtures differ.

Historically a mixture of Prussian blue and gamboge. Modern products can use different pigments: the consulted Winsor & Newton Professional Watercolour product lists PG36 and PY110. Therefore a single generic hex code would conceal substantial material differences. The article does not repeat an uncertain person-attribution for the name. [22,23]

Hot Magenta — Crayola

Product color name. Named marker and other art-media color.

Crayola's Bright Ultra-Clean marker product lists hot magenta. That confirms the product name, but the consulted page does not supply a numeric color specification. The xkcd survey's hot magenta is separately identified and must not be presented as Crayola's formula or standard. [31]

Hot Pink — Crayola

Product color name. Named marker color.

Also named on the consulted Bright Ultra-Clean marker page, without verified RGB or hex coordinates. CSS hotpink, X11 hot pink, xkcd hot pink, and commercial paints carrying related names have their own source-specific definitions. [12,13,31]

Unresolved source records

These 56 candidates are excluded from the 935-record numeric total: 52 Pantone TPG dealer rows with disagreeing RGB and hex fields, Resene Hero, one Virginia Tech Hokie Stone tint, and two records without numeric values. The table preserves the conflicting fields exactly as consulted; it does not endorse either candidate. No swatch is generated from an unresolved choice.

Heritage Red — COLORSTEEL via Resene (not supplied). The consulted page supplied no RGB or hex value. [Consulted source](#).

Hushed Copper — PPG (MTL141). The consulted page supplied no RGB or hex value. The PPG page describes a metallic golden-brown appearance, which a single flat digital value would not fully characterize. [Consulted source](#).

Hydro Pantone TPG / dealer	18-4718 TPG	#496C77	72, 108, 119

Frequently asked questions

How many H colors are there?

There is no fixed worldwide total. This edition documents 935 numeric records under its stated inclusion rules, plus 56 unresolved catalog candidates and 14 contextual terms or product-name discussions. These sets overlap in wording, so their totals must not be added and called a count of unique color names.

Which H names are standard CSS keywords?

The two H-starting named-color keywords in the consulted CSS Color table are honeydew (#F0FFF0) and hotpink (#FF69B4). Spaces matter in code: the CSS keyword is hotpink, not the two-word phrase “hot pink.” A paint called Harbor Blue or a survey label such as hunter green does not automatically become a CSS keyword. [12]

Are X11 names interchangeable with CSS names?

Only where the specifications actually agree. The X11 source includes numbered variants such as honeydew2 and HotPink3 that are not CSS named-color keywords. X11 aliases with the same RGB value are combined within this directory; for example, honeydew and honeydew1 share a record, and hot pink and HotPink share another. The standard CSS records remain separate because their source context differs. [12,13]

Why does Heliotrope appear more than once?

It has source-specific uses. Resene’s preview, a Pantone-labeled dealer preview, and the xkcd survey value differ markedly. They should not be merged merely because their names match. Figure 2 places them side by side. A general flower-derived name is not itself a numerical standard. [7,10,11]

Are Purple and Violet scientifically different in this table?

The table uses them as practical neighboring families of screen colors. This does not classify a light source by its spectrum. Violet light can be discussed spectrally in physics, while many purple appearances arise from combinations of wavelengths; the directory’s family labels are not spectral measurements. [36]

Does a color name reveal its ingredients?

Usually not. A paint called Hemlock need not contain the plant; a commercial Henna preview is not necessarily made from henna. Pigment identity requires product or analytical documentation. Hooker’s green illustrates why the same artists’ color name can cover different mixtures. [22–24]

Can these codes be converted directly into paint or CMYK?

A screen coordinate is not a paint-mixing recipe. A trustworthy print conversion also depends on the printer, ink, paper, and color profile. No universal CMYK equivalents, pigment recipes, or physical nearest-match claims are manufactured for this list. Use the target process’s specifications and samples. [16,17]

Why retain entries marked archived?

Historical and archived catalog names help readers identify older specifications. The source flag is explicitly retained, while current retail availability is not inferred. A record’s inclusion means that its cited numeric evidence was consulted, not that every product line currently offers it.

Why are some familiar internet names absent?

A familiar label may have no traceable authoritative numeric definition, may belong to an inaccessible catalog, or may fail the letter-H rule. The article prioritizes identifiable sources over copying unsourced color-name compilations. Its scope is strongest in English-language US, UK, and New Zealand catalogs and selected standards, and is not an inventory of every language, manufacturer, product medium, or historical dictionary.

Can another shade judgment be reasonable?

Yes. Color-family boundaries are conventional and can be especially uncertain for near-neutrals, olive colors, teal, dusty rose, and lavender. The source identity and exact RGB stay fixed when the editorial family changes, making any later review reproducible.

Glossary

Alias

Another spelling or identifier used for the same source-specific color; documented aliases are retained without automatically counting them as new colors.

Chroma

The strength of departure from a neutral appearance in a specified color system; it is not interchangeable with every software saturation control.

Color space

A defined system for specifying color coordinates and their interpretation.

Colour Index pigment code

A pigment designation such as PG36 or PY110. The letters indicate a pigment class and broad color group; it is not an RGB code.

Gamut

The range of colors a device, material system, or color space can represent under stated conditions.

Hex code

Here, a six-digit base-16 representation of three eight-bit RGB channels, written #RRGGBB.

Hue

The aspect of color associated with appearances such as red, yellow, green, or blue; very near-neutral colors may have only a weak hue.

Lightness

Perceived lightness relative to a reference white or surrounding conditions; distinct from the encoded channel values themselves.

LRV

Light reflectance value, a material-related measure on a nominal 0–100 scale; not the same field as computed sRGB relative luminance.

Pigment

A coloring material dispersed as particles in a medium. A dye is typically used in dissolved form or interacts with a substrate differently.

Relative luminance

For the contrast calculations here, a dimensionless weighted combination of linearized sRGB components, with reference black at 0 and white at 1.

sRGB

A standardized RGB encoding defined by IEC 61966-2-1; the working display space used for this publication.

Swatch

A small color sample. A digital swatch is a screen representation, not necessarily a physical reference standard.

TCX / TPG

Pantone Fashion, Home + Interiors suffixes that identify different material reference systems. They are retained in full; dealer screen previews are not treated as licensed Pantone specifications.

Tint / shade / tone

Common teaching terms for lightening, darkening, or modifying a color with a neutral; commercial variant labels need their own source definition.

Undertone

A descriptive tendency toward another hue, especially in muted colors; not a substitute for a measured color coordinate.

To go further

For screen color definitions, consult W3C CSS Color [\[12\]](#) and the ICC sRGB registry [\[17\]](#). For accessible text contrast, use the WCAG recommendation and its explanatory material [\[18,38\]](#). For historical pigments, CAMEO offers specialist conservation entries [\[19,21,22,24\]](#). For foundational color matching and visual context, read Feynman, Leighton, and Sands, chapter 35 [\[36\]](#), while recognizing the historical date of its physiological discussion.

How to update this article

Use the source URL, source code, and H-ID together. Verify a changed value at the primary source, check RGB/hex consistency, then review the rendered swatch and any affected family counts, figures, contrast ratios, and aliases. Retain an earlier value only if it has a dated source or a clearly identified historical context. The H-IDs belong to this edition and should not be treated as manufacturer identifiers.

References and source links

All cited pages, datasets, and supplied materials were consulted for this edition. Live-source access was checked on October 14, 2026. A publication date is given where established; undated pages are not assigned an invented year. Individual numeric rows link directly to their own evidence. References to the 1992 pigment paper are limited to the consulted institutional abstract.
