

GKBook

Colors That Start With I

An illustrated directory of names, RGB and hex values, and independent shade-family judgments

614 records	484 displayed names	12 shade families
Source-specific numeric entries	Aliases separately recorded	Independent editorial judgments

An illustrated, source-linked reference for high school and college students. Includes a complete numeric directory, worked examples, material and cultural context, unresolved-source records, and a companion swatch atlas.

Research checked: October 14, 2026
Language: US English
Scope: Source-bounded international reference; no worldwide completeness claim.

Overview

What are I colors?

I colors are colors whose recorded names begin with the letter I. They form an alphabetical group, not a scientific class. The group includes the dark violet of the CSS keyword indigo, the pale cream of CSS ivory, red iron-oxide pigments, and hundreds of commercial paint names. A reliable entry identifies the source as well as the name: “Ivory” alone does not specify one universally agreed color.

This edition documents **614 source-specific numeric records, 484 distinct displayed names, and 611 distinct RGB triplets**. It includes ten paint manufacturers, three institutional palettes, web and software definitions, survey labels, and clearly identified dealer or supplier previews. Another **38 source records** are reported separately because the consulted evidence lacks numbers or contains conflicting RGB and hex fields. Contextual entries explain important material, historical, and language terms without inventing digital specifications.

GKBook’s independent visual judgment determines each final shade family. The same 12-family approach used for H colors is applied here. The source’s authentic name, code, numeric value, and classification remain separately recorded. A maker’s label is evidence about its catalog; it does not overrule the editorial assessment of the displayed swatch. [\[1\]](#)

The list is extensive within a stated, reproducible scope. There is no authoritative worldwide register of every I color name, and commercial names continually change. No claim of worldwide completeness or superiority is made. The aim is a useful, verifiable reference for students, artists, designers, and editors.

At a glance

Measure	This edition
Numeric records	614
Distinct displayed names	484, excluding separately noted aliases
Distinct RGB triplets	611
Source groups	20 (including ten paint manufacturers)
Unresolved catalog candidates	38; excluded from numeric totals
Contextual terms and product-name discussions	22; some names overlap the numeric directory

Reading a color record

The name needs a source

A color name can describe a material, a visual impression, a software value, or a product. Those uses are related but not interchangeable. The directory's source and source code identify the particular definition. Its I-number is only a GKBook reference ID for this edition. Click a source label to inspect the consulted page; the CSV and JSON companions preserve full URLs and additional provenance.

Source spellings and capitalization are retained, including Gray and Grey. Names are alphabetized without regard to case, spaces, punctuation, or accents, then by source and code. The company name is separated from the color name: Resene Indian Ink is listed under Indian Ink. Names beginning with Dark, Light, or Pale are not moved into I merely because a later word begins with I. Actual named variants such as Ice Pack Half are included; unlisted variants are not generated.

What a record contains

Each numeric entry gives a name, source, code when supplied, swatch, RGB triplet, hex value, and GKBook family. The evidence note distinguishes standardized keywords, manufacturer previews, institutional palettes, survey labels, and dealer approximations. Source families and light reflectance values (LRVs) are included when reliably supplied. A blank field means unavailable or not established, never a measured zero.

Different sources can attach the same name to strikingly different values. CSS indigo is #4B0082, Benjamin Moore Indigo is #A1CFD7, and the consulted Pantone TCX dealer table calls #4C3957 Indigo. All three are kept under their own sources. Figure 1 also compares Ivory and Indian Red. Equal names are not grounds for merging different swatches. [\[3,10,12\]](#)

Evidence categories

Manufacturer records report the maker's published digital preview. CSS values are standardized sRGB keywords; X11 values belong to a particular software dataset. Institutional colors apply to the cited organization or unit. The xkcd entries document survey-derived screen labels. Pantone-labeled rows are **dealer approximations**; this edition does not authenticate current licensed Pantone specifications. COLORSTEEL and COLORBOND records are supplier previews hosted by Resene. [\[2-21\]](#)

An archived-source flag is preserved for 63 records. Such a flag is catalog metadata, not proof that the paint can or cannot still be ordered. Similarly, an access date is the date a source was checked, not the date a color name originated. Product availability, regional formulations, and historical continuity require separate evidence.

GKBOOK / I-COLORS / FIGURE 1

Original graphic for GKBook • Values checked October 14, 2026

Figure 1. Why a color name needs its source Indigo, Ivory, and Indian red each identify different published previews across sources. Names alone do not establish numerical or physical equivalence. Pantone-labeled Indigo is a dealer approximation.

Understanding RGB, hex, and physical color

RGB describes colored light

An RGB triplet gives red, green, and blue channel values. In the eight-bit notation used here, each channel is an integer from 0 to 255. Thus $256 \times 256 \times 256 = 16,777,216$ encoded combinations are possible. This counts numerical codes, not all perceivable colors or all colors in nature. A color space supplies the primaries, reference white, and encoding needed to interpret the numbers. [12,17]

CSS named colors use **sRGB**. All swatches in this publication are rendered as sRGB for comparison. When a manufacturer does not specify the encoding of its website values, treating them as sRGB is an explicit working assumption, not a verified measurement of the physical paint. Encoded channel values are nonlinear; twice the code value does not mean twice the emitted light. [12,17]

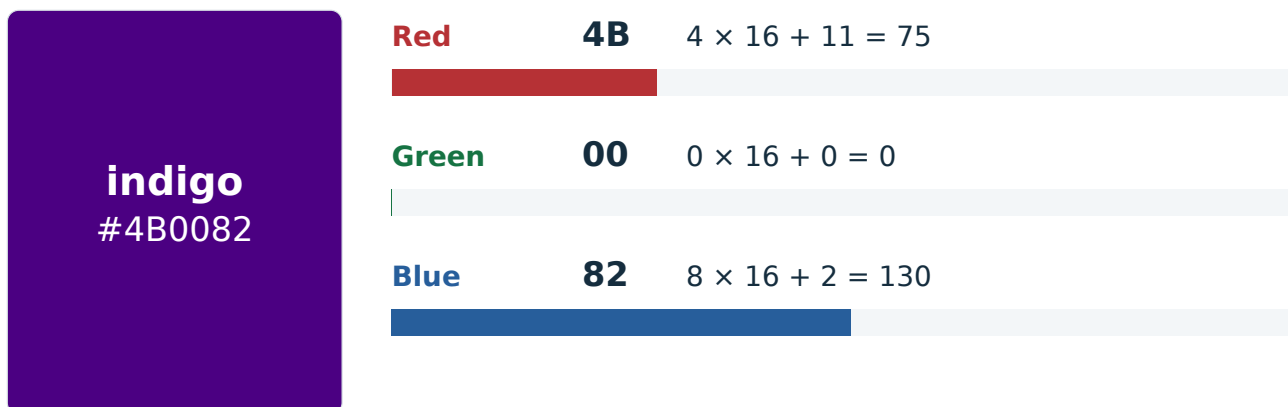

Worked example: reading #4B0082

Hexadecimal is base 16: A through F represent 10 through 15. A six-digit color code splits into red, green, and blue pairs: **#RR GG BB**. For CSS indigo, $4B = 4 \times 16 + 11 = 75$; $00 = 0$; and $82 = 8 \times 16 + 2 = 130$. Therefore #4B0082 and RGB (75, 0, 130) are exactly equivalent. Figure 2 illustrates the conversion. Uppercase and lowercase hexadecimal letters have the same value. [12]

GKBOOK / I-COLORS / FIGURE 2

Reading a six-digit hex color

CSS indigo • #4B0082 • RGB (75, 0, 130)

Each channel uses 0–255. Bars show encoded values.

Original graphic for GKBook • Values checked October 14, 2026

Figure 2. Reading a six-digit hex color The three hexadecimal pairs encode the red, green, and blue channels of CSS indigo. Bar lengths show code values, not linear light or paint proportions.

A useful verification test

RGB and hex are two ways of stating the same eight-bit value. They must convert exactly. A dealer row that supplies different values in its two fields is internally inconsistent even if the resulting colors look nearly identical. Thirty-seven TPG dealer rows fail this check and are listed in the unresolved appendix. Selecting the visually more attractive number would not resolve what the source intended.

Why a screen is not a paint sample

A screen emits light; paint selectively reflects illumination. Appearance also depends on the surroundings, viewing conditions, surface, and material. Two samples that match under one light can differ under another because matching appearance does not require identical reflectance spectra. Brown, for example, is strongly affected by its relationship to brighter surroundings. [36]

A single flat RGB value cannot encode metallic sparkle, fluorescence, transparency, texture, or angle-dependent iridescence. Use the directory to compare names and digital previews. For a physical specification, consult a suitable material sample or licensed standard under the intended lighting. A shared hex code is not evidence that two paints have the same pigments or match in every environment. [7,9,17,48]

Names, shades, and GKBook's 12 families

A consistent editorial convention

The families are **Black, Blue, Brown, Gray, Green, Orange, Pink, Purple, Red, Violet, White, and Yellow**. Every included swatch was visually inspected after preliminary computer grouping. The final classification considers apparent hue, lightness, and strength of color together. Source voting does not determine the answer. Identical RGB values receive identical families, including when repeated under different sources.

The approach follows the reviewed H-color reference. Brown includes many tans, beiges, taupes, and earthy warm appearances. Gray includes near-neutral appearances with weak undertones. White includes very pale near-neutrals and selected creams. Distinctly colored pastels may remain Blue, Green, Pink, or Yellow. These are practical boundaries for this directory, not universal scientific categories. [1]

Purple generally covers red- or magenta-leaning purples; Violet generally covers comparatively blue-leaning purples and lavenders. Teal and turquoise are assigned to Blue or Green according to their rendered appearance. Olive may fall in Green, Yellow, or Brown. A label of Violet does not establish a single spectral wavelength, and a family decision does not invalidate an authentic name.

Examples where editorial judgment prevails

Little Greene classifies Invisible Green as Green; GKBook places its very dark #2E2B14 preview in Brown. Its Ivory #F6DC96 is in the maker's Off White category and in GKBook's Yellow family. Behr's Indigo Ink #3B4354 changes from the source family Purple to editorial Blue, while Iris Petal #6B6273 changes from Purple to Gray. Figure 3 shows the original values and both classifications. [2,21]

Shade, tint, tone, and named strength

In common art instruction, a tint is lightened with white, a shade is darkened with black, and a tone is modified with gray. Everyday "shade" is much broader. A product name does not guarantee a mixing formula. Half and Quarter variants in the Dulux catalog are separately published colors, not instructions to halve RGB channels. The directory uses **family** for its broad association and preserves every authentic variant name. [20,39]

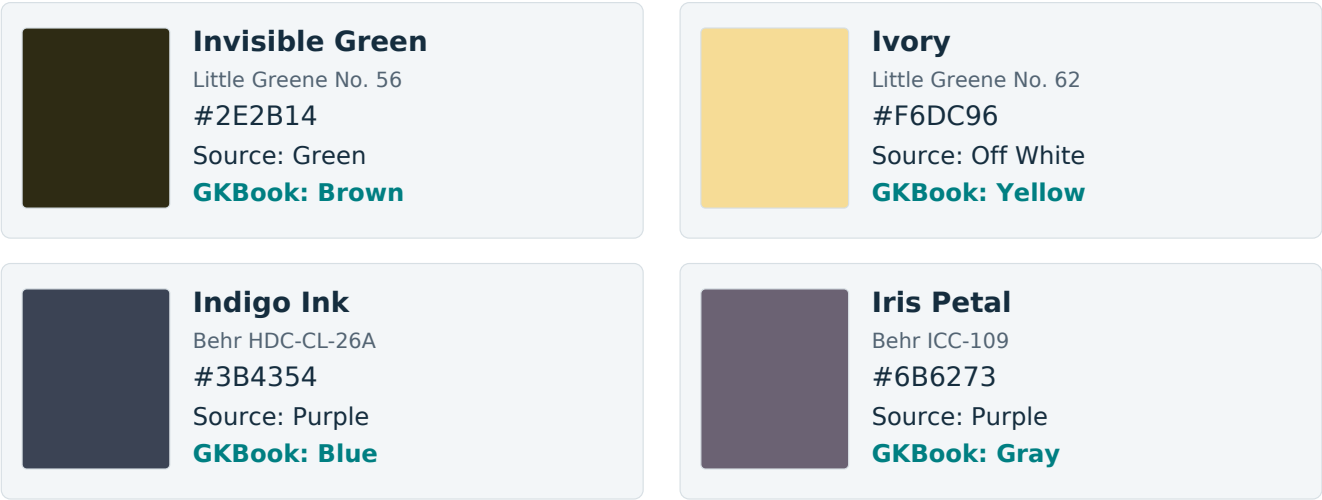

The limits of judgment

Borderline colors can reasonably be placed in neighboring families by another observer or under another display setup. GKBook's decisions are explicit and consistent for the supplied digital values; they are not measurements of a physical sample or revisions to an official standard. Names such as Ink Black, Inchyra Blue, and Ivory therefore remain intact even when their displayed previews are classified differently.

GKBOOK / I-COLORS / FIGURE 3

Source categories and editorial judgments

Original values stay fixed. GKBook independently assigns the shade family.

Original graphic for GKBook • Values checked October 14, 2026

Figure 3. Source categories and editorial judgments These examples show independent GKBook shade decisions while preserving the maker’s original names, values, and classifications.

Using colors accessibly

Contrast must be calculated

Color names do not establish text readability. WCAG 2.2 generally requires a contrast ratio of at least 4.5:1 for ordinary text and 3:1 for qualifying large text, with stated exceptions. Each directory note reports whichever gives the greater calculated contrast: pure black or pure white text against the opaque sRGB swatch. This limited comparison does not constitute a complete accessibility assessment. [18]

Worked example: white text on indigo

First divide each RGB channel by 255. For normalized encoded channel c , calculate $c/12.92$ if $c \leq 0.04045$; otherwise calculate $((c + 0.055)/1.055)^{2.4}$. These give linear-light components R , G , and B . Relative luminance is $Y = 0.2126R + 0.7152G + 0.0722B$. The contrast ratio is $(Y_{\text{lighter}} + 0.05)/(Y_{\text{darker}} + 0.05)$. [38]

For #4B0082, the encoded channels normalized to 0–1 are approximately (0.2941, 0, 0.5098). After linearization they are approximately (0.07036, 0, 0.22323), giving $Y \approx 0.03108$. White text has contrast $1.05/(0.03108 + 0.05) \approx \mathbf{12.95:1}$. Black text has contrast $(0.03108 + 0.05)/0.05 \approx \mathbf{1.62:1}$. White satisfies the ordinary-text threshold for this opaque background; black does not. Calculations use unrounded values.

LRV is a material measurement

A paint's **light reflectance value** expresses visible light reflected under specified measurement conditions, on a nominal 0–100 scale. The source's supplied LRV is retained. Screen luminance Y calculated from the RGB preview is a different field: multiplying Y by 100 does not create a verified paint LRV. [37]

Keep text labels, IDs, and values visible; do not rely on color alone. Check the actual font, size, background, transparency, and display context. Graphics include text alternatives and readable labels. The companion HTML provides the complete text and directory. The PDF is searchable and bookmarked, but this edition does not claim full PDF accessibility tagging.

Indigo: a name linking chemistry, history, and design

One word, several different referents

Indigo can mean a dye, its blue coloring component indigotin, a general color impression, an artists' paint, or an exact software keyword. Indigotin has formula $C_{16}H_{10}N_2O_2$. Natural indigo preparations can contain additional compounds; the word alone is not a purity specification. The dye's general blue appearance must not be equated with the Violet family assigned here to CSS indigo. [12,22,23]

How vat dyeing works

Indigo is poorly soluble in water. In conventional vat dyeing, reducing conditions in an alkaline bath convert it to a soluble **leuco** form that can enter the textile. Exposure to air then oxidizes the dye back to insoluble indigo, producing the blue coloration. Figure 4 separates this dyeing cycle from plant extraction. The schematic omits reaction stoichiometry, bath formulation, and industrial process details; it is not a laboratory recipe. [23,24]

A plant precursor such as **indican** is chemically different from leuco-indigo. Indican is a sugar-linked form of indoxyl; cleavage releases the precursor from which indigo can form. Confusing plant extraction with vat reduction obscures why an already-made blue dye must be chemically changed before conventional application. [24]

A global history

A 2016 analytical study identified indigoid dyes in cotton textiles from Huaca Prieta on Peru's north coast. Its oldest investigated textiles were approximately 6,000–6,200 years old, dated through their archaeological context. The authors described them as the earliest identified indigo use known at publication. They did not prove a unique botanical source or the exact dyeing procedure, and this article does not turn that dated research claim into an unqualified present-day world record. [23]

Indigo traditions extend well beyond one country or one plant species. The Peruvian study discusses indigo-producing genera including Indigofera, Isatis, Strobilanthes, and Polygonum. Its South American evidence is a useful corrective to assuming that the English name identifies a single geographical origin for all indigo use. [23]

Current research, carefully qualified

A 2024 study investigated making indican with an engineered enzyme and forming indigo on denim through enzymatic or light-driven routes. The work included modeled economic and environmental assessments. It demonstrates research possibilities for reducing reliance on conventional dye-bath chemicals; it does not establish that the processes have replaced commercial vat dyeing worldwide. [24]

An artists' paint may be a mixture

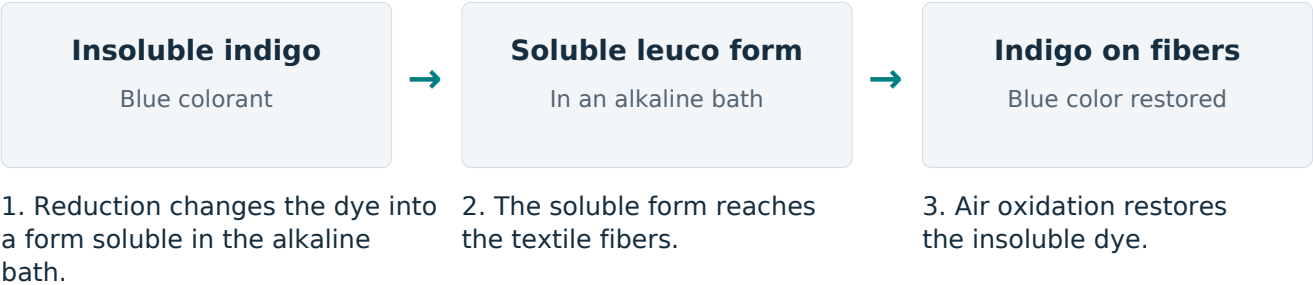

Winsor & Newton's consulted Professional Watercolour Indigo lists PB15, PBk6, and PV19, rather than indigotin as its pigment specification. This is a modern paint sold under an appearance-based name. Its properties must be read from that product's formulation, not inferred from the chemistry of natural indigo. [31]

GKBOOK / I-COLORS / FIGURE 4

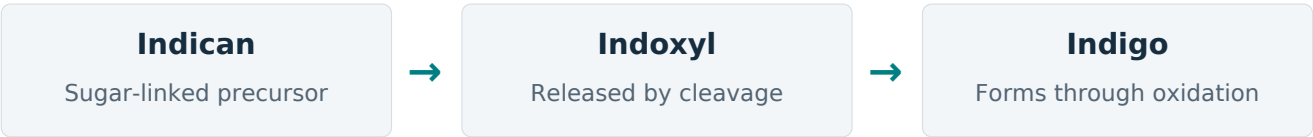

Indigo: precursor chemistry and vat dyeing

Simplified process diagram • No reaction conditions or mixing recipe implied

A. Conventional vat dyeing

B. A plant-precursor route

Indican and leuco-indigo are different substances. Layout colors are not measured sample colors.

Original graphic for GKBook • Values checked October 14, 2026

Figure 4. Indigo: precursor chemistry and vat dyeing Conventional vat dyeing reduces already-made indigo before application. Indican instead supplies a chemical precursor. The lower route summarizes precursor cleavage and oxidative indigo formation; it does not depict every plant-extraction or photochemical route.

Source coverage and family guide

Inclusion requires a directly consulted named source record beginning with I. Numeric entries must have a traceable RGB or hex definition; one representation may be derived exactly from the other, but conflicting paired fields are excluded. The 614 entries represent 484 main displayed names and 611 distinct RGB triplets. Counts are case-insensitive for names; X11 aliases are preserved without duplicate counting.

Systematic discovery used Behr's full index, Benjamin Moore's family data, Sherwin-Williams downloadable tables, Dunn-Edwards CAD books, both pages of Resene's I index, PPG's sitemap, all 45 I-initial Asian Paints Decorpro cards, and 88 I-initial pages in the consulted Dulux Australia sitemap. Individual primary pages were checked where specified. Farrow & Ball and Little Greene coverage consists of the three and four selected verified product pages listed in the source registry; their entire historical catalogs are not claimed as exhausted.

The remaining records come from three CSS keywords, ten grouped X11 records, nine xkcd survey labels, five institutional records, and 51 internally consistent Pantone-labeled dealer previews: 44 TCX and seven TPG. An intermediary attribution is not independent authentication of a proprietary standard. Thirty-seven conflicting TPG rows and one PPG record without numbers are excluded from the numeric total.

Sherwin-Williams Indian White SW 0035 is deliberately retained as a historical-table record at #EDDDC3. The consulted current page for the code says Warm Beige and supplies #EEDAC3. The old I-name is not silently attached to the new preview. Six other Sherwin-Williams entries use their checked individual-page values where those differ from discovery tables; both values are recorded in the editorial notes.

Regional coverage is weighted toward the consulted English-language catalogs in the United States, United Kingdom, Australia, New Zealand, and India. It does not systematically enumerate every language, manufacturer, discontinued range, national standard, textile library, cosmetics line, printing ink, automotive finish, or informal internet name. A repeated web list does not establish an independent color standard.

No physical samples were measured. Source LRVs and metadata flags are reported as published. Borderline family decisions remain editorial, and material effects cannot be fully represented by the supplied flat swatches. The H article provided the organizational and shade-association framework; its H-specific names, counts, and facts were not imported into the I inventory. [1]

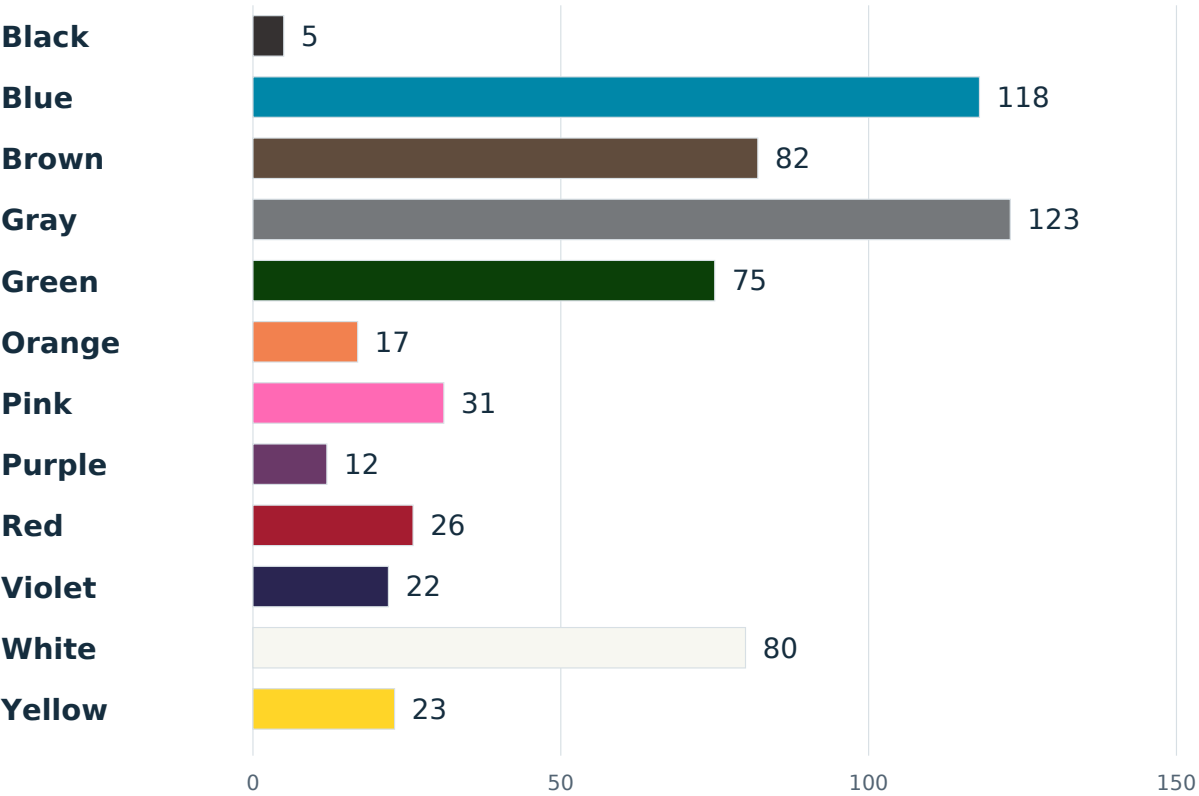

Numeric records by source

Source group	Records	Evidence context
Behr	111	Maker index and individual pages
Dulux Australia	88	88 primary pages found through sitemap
Benjamin Moore	65	Maker family data and individual pages
PPG	58	Sitemap and individual pages
Sherwin-Williams	58	Maker tables and pages; one historical record
Resene	54	Two-page I index and individual previews
Dunn-Edwards	46	2025 CAD books and individual pages
Asian Paints	45	45 primary Decorpro catalog cards
Pantone TCX / dealer	44	44 dealer approximations only
X11 / X.Org	10	rgb.txt 1.1.1; aliases combined
xkcd survey	9	Published survey-label dataset
Pantone TPG / dealer	7	Seven internally consistent dealer rows
Little Greene	4	Four selected maker website hex fields
COLORSTEEL via Resene	3	Three supplier previews; maker standard unverified
CSS Color	3	Three standard sRGB keywords
Farrow & Ball	3	Three selected maker base swatches
University of Illinois	3	Three official brand colors
COLORBOND via Resene	1	One supplier preview; maker standard unverified
Imperial School of Medicine	1	One school web-guide context
Indiana University	1	IU Crimson in official palette

The 12 editorial families

Number of numeric records in this edition • n = 614

Counts are source-dependent; each record is counted once. • GKBook, October 14, 2026

Figure 5. The 12 editorial families Counts are based on the included source-specific records after visual editorial review. A name appearing under two sources contributes two records. These bars do not measure cultural preference, usage frequency, or natural abundance.

Family navigation and supplementary figures

Family	Records	Interpretation / atlas reference
Black	5	Very dark near-neutral appearances. Supplementary Figure 6.
Blue	118	Blues, cyan-leaning blues, and selected blue teals. Supplementary Figure 7.
Brown	82	Browns, many tans, beiges, taupes, and earthy warm colors. Supplementary Figure 8.
Gray	123	Near-neutral appearances with weak warm or cool undertones. Supplementary Figure 9.
Green	75	Greens, selected olives, mint tones, and green-leaning teals. Supplementary Figure 10.
Orange	17	Oranges, selected peaches, and warm amber appearances. Supplementary Figure 11.
Pink	31	Pinks, roses, blushes, and selected bright magenta-pinks. Supplementary Figure 12.
Purple	12	Generally red- or magenta-leaning purple appearances. Supplementary Figure 13.
Red	26	Reds, burgundies, and selected brick or crimson colors. Supplementary Figure 14.
Violet	22	Generally blue-leaning purples and lavenders. Supplementary Figure 15.
White	80	Very pale near-neutrals and selected creams or tinted whites. Supplementary Figure 16.
Yellow	23	Yellows, golden tones, and selected yellow-green or cream colors. Supplementary Figure 17.

Figures 6–17 are supplied as the separate GKBook-I-Colors-Atlas.pdf and as numbered SVG and PNG sheets. Together they show every one of the 614 numeric records once. Figures may span several sheets; the sheet number is printed on each graphic.

Alphabetical directory

614 numeric records • Every source label is a citation. The swatch and hex code are the same eight-bit RGB value. Family is GKBook’s judgment. “Screen” notes compare pure black or white text against an opaque sRGB background. Source-family and LRV fields retain the publisher’s meaning.

The directory does not label dealer values as verified Pantone standards. Archived-source flags are retained, and source spelling is preserved. Same-value X11 aliases are stated in the notes. Historical Indian White is identified as a historical-table record.

Record category	How to read it
Maker preview	Published digital value; physical appearance can differ.
Standard / dataset	Exact for the cited specification or dataset context.
Institutional	Apply only in the specified unit and palette.
Dealer / supplier preview	Attribution verified at the cited intermediary; current maker standard unverified.

Material names and cultural context

The following 22 discussions verify useful names or concepts without pretending that each has one universal RGB value. They are not additional numeric swatches, and some names overlap the directory. Descriptions such as Blue or Green below are general contextual descriptors, not a new measurement of a physical sample.

Ianthine

Language term. Violet-related adjective.

Collins defines ianthine as having a violet color. This verifies a useful English descriptive term, not an exact wavelength or RGB code. It is distinct from a manufacturer's named Iris or Indigo shade. [44]

Icterine

Qualified word-list usage. Yellow-related adjective; no verified numeric standard.

The Association of British Scrabble Players includes icterine among color words, describing yellowish or yellow-marked appearance. This article records that specific usage only. No authoritative fixed RGB value was established, and widely circulated internet hex assignments are not adopted. [54]

Imperial yellow

Historical and cultural term. Yellow; meaning depends on object and period.

The V&A's museum record for an emperor's court robe dated 1875–1908 uses imperial yellow or bright yellow for the ground color and connects it with restricted Qing court use. That historical textile context is not a universal digital standard. Modern paints named Imperial Yellow remain separate source-specific products. [52]

Inaurate

Language and appearance term. Gilded or gold-like; not one flat color.

Collins records the adjective for a gilded or apparently gilded surface. Such an appearance involves reflectance and luster as well as hue. A plain yellow or brown RGB rectangle cannot fully represent gilding. [47]

Incarnadine

Language term and paint name. Crimson or pale pink, depending on sense.

Dictionary.com records both a blood-red/crimson sense and an older flesh-colored/pale-pink sense. The latter is historical wording, not a universal human skin color. A dictionary's multiple senses explain why the word cannot independently specify a single swatch. Resene and Farrow & Ball supply their own numeric Incarnadine records. [7,9,46]

Inchworm — Crayola

Product color name. Maker's Green hue family; digital standard unverified.

Crayola's Explore Colors page lists Inchworm in Green, and its FAQ identifies it among the colors introduced in 2003. These sources verify the name and manufacturer association. No authoritative numerical color specification was established for this edition, so a borrowed hex value is not substituted. [55]

Indanthrene blue

Artists' pigment and product name. Blue; product-specific material.

The consulted Winsor & Newton Artists' Oil Colour Indanthrene Blue lists PB60. This is a pigment designation, not CSS indigo and not the same material merely because both names begin with Ind-. The product page supplies no adopted standard RGB value here. [40]

India blue; intense blue

Historical indigo aliases. Blue; see Indigo.

CAMEO lists India blue and intense blue among terms related to indigo. They are preserved as material cross-references rather than counted as additional universally specified swatches. An unrelated commercial product could use similar wording with its own definition. [22]

India ink; Indian ink

Drawing medium and color term. Usually black or near-black; formulation-dependent.

Modern India ink commonly uses finely divided carbon black in a binding medium. India ink and Indian ink are related names in the conservation reference. Ingredients and waterproofing depend on the product; a named paint such as Resene Indian Ink is not therefore made from drawing ink. No universal hex code follows from the medium's name. [34]

India Yellow (Hue)

Modern artists' color name. Yellow; substitute formulations vary.

Golden Artist Colors' 2021 article announces use of India Yellow (hue) for the company's relevant GOLDEN, Williamsburg, and QoR products. "Hue" here identifies a modern appearance-based replacement rather than the historic Indian-yellow material. The article's comparisons show why binder, tinting, and formulation matter. [29]

Indian red; India red

Iron-oxide pigment and historical term. Red to earthy red-brown.

CAMEO associates the name with red earths historically imported from India and the Persian Gulf and with synthetic iron-oxide artists' pigments. The consulted Winsor & Newton Indian Red lists PR101. CSS indianred is a separately standardized screen value, not a chemical recipe or a measurement of all Indian-red pigments. [12,25,26]

Indian Red — Crayola, historical

Historical product name. Renamed Chestnut in 1999.

Crayola states that the color was introduced as Indian Red in 1958 and renamed Chestnut in 1999. This is a verified product-name history. It does not rename the unrelated CSS keyword, all iron-oxide pigments, or every paint product using Indian Red. No unverified historical crayon RGB is supplied. [43]

Indian yellow

Historical organic pigment. Golden yellow; historical production details require care.

CAMEO describes the historical pigment and repeats the cow-urine/mango-leaf account, including a specific prohibition date of 1908. Kew explicitly notes missing documentary evidence for the supposed prohibition, while Golden's material study and research discussion consider the animal-origin account likely. These are different questions: evidence favoring an animal origin does not independently establish the date or legal form of a ban. This edition does not state a verified worldwide 1908 ban. [27-29]

Indian Yellow — modern watercolor

Modern product name. Yellow; distinct from the historical pigment.

The consulted Winsor & Newton Professional Watercolour Indian Yellow lists PO62 and PY139. This directly demonstrates that a current product can retain the traditional color name while using a different pigment formulation. Do not generalize one product's permanence, transparency, or ingredients to every paint sold as Indian yellow. [30]

Indigo — Crayola

Product color name. Named colored pencil; no verified numerical swatch.

Indigo appears on page 2 of Crayola's 100 Pencil Color Chart. The worksheet is designed for the user to color, so it verifies the name without supplying a colored reference patch or RGB code. It must not be silently equated with CSS indigo or another company's Indigo paint. [53]

International Klein Blue (IKB)

Art-historical color and material process. Intense ultramarine blue; no universal sRGB adopted.

Yves Klein's IKB is associated with intense ultramarine pigment and a synthetic-resin binding process. Centre Pompidou documents the May 19, 1960 deposit of Soleau envelope no. 63471 concerning that process. This article makes no legal claim of ownership or a patent over the color itself. A flat internet hex approximation cannot reproduce the material surface of a Klein work. [50,51]

International Orange

Technical and architectural name. Orange to red-orange; application-specific.

The Golden Gate Bridge District distinguishes its bridge International Orange from other colors of that name, including aerospace uses. Irving F. Morrow's April 1935 report belongs to the bridge's color-selection history. The district publishes CMYK percentages of 0, 69, 100, and 6; those are not a universal RGB conversion. No print profile is supplied here from which to derive an authoritative hex match. [56]

Iridescent; iridescence; irisation

Optical appearance, not a single hue. Color changes with viewing geometry or optical structure.

Iridescence commonly describes surfaces whose apparent color changes with angle because of optical structure and interference. The WMO also uses irisation or iridescence for colored cloud effects, involving diffraction or interference depending on geometry. Such an effect cannot be reduced to one permanent color code. A product named Iridescent Peacock may still have a flat website preview; the name alone proves no physical iridescent effect. [48,49]

Iron grey — RAL 7011

Material color standard. Official RAL CLASSIC name and code.

RAL identifies 7011 as Iron grey; the official spelling is retained. The consulted page verifies the material-standard name and identifier. No current licensed or otherwise authoritative RGB conversion was established for this edition, so none is invented. [42]

Isabella; Isabel; isabelline

Language terms. Grayish yellow; historical reference uncertain.

Collins records Isabella, also Isabel, for a grayish-yellow color and gives isabelline as a related form. It describes the original personal-name reference as uncertain. Popular stories connecting the color to a specific royal person's unchanged clothing are therefore not presented as established etymology. No fixed digital value is implied by the lexical definition. [45]

Ivory — RAL 1014

Material color standard. Official RAL CLASSIC name and code.

RAL identifies 1014 as Ivory. That material standard is distinct from CSS ivory, Little Greene Ivory, Asian Paints Ivory, and other named products. The source page establishes the name and code, not a universal interchangeable hex value. [41]

Ivory black

Historical and modern artists' pigment name. Black; commonly associated with bone black today.

The historical name refers to carbonaceous black made from charred ivory or related animal material. Modern products commonly use bone black; the consulted Winsor & Newton watercolor lists PBk9. The name does not establish that a present-day product contains elephant ivory. It also does not require the digital preview to be pure RGB black. [32,33]

Unresolved source records

These 38 candidates are excluded from the 614-record numeric total: 37 Pantone TPG dealer rows with disagreeing RGB and hex fields, and PPG Iridescent Oyster without a numeric swatch. The table preserves the conflicting fields exactly as consulted; it endorses neither alternative. No swatch is generated from an unresolved choice.

Iridescent Oyster — PPG (MTL131). The consulted page supplied no RGB or hex value. [Consulted source](#).

Frequently asked questions

How many colors begin with I?

No fixed worldwide total exists. This edition contains 614 source-specific numeric records and 484 main displayed names. It separately reports 38 unresolved source records and 22 contextual discussions. Those sets overlap in wording and must not be added together as a count of unique color names.

Which I names are standard CSS keywords?

The consulted CSS named-color table contains exactly three I-initial keywords: indianred (#CD5C5C), indigo (#4B0082), and ivory (#FFFFFF0). Their RGB values are (205, 92, 92), (75, 0, 130), and (255, 255, 240). A product named Ice Blue does not automatically become a valid CSS keyword. [\[12\]](#)

Is indigo blue, purple, or violet?

The answer depends on the referent. The dye is broadly blue, CSS indigo is assigned Violet in this editorial scheme, the Pantone-labeled dealer Indigo is Purple here, and Benjamin Moore Indigo is a pale Blue. Giving the source and code resolves the apparent contradiction. [\[3,10,12,22\]](#)

Are all ivory colors white?

No. CSS ivory is classified White, Little Greene Ivory Yellow, and Asian Paints Ivory Brown in this edition. These decisions describe the published digital swatches under the shared GKBook rules. The authentic names remain unchanged. [\[12,19,21\]](#)

Is Indian red still a legitimate color name?

It remains a CSS keyword and an artists' pigment name. Crayola's historical Indian Red was renamed Chestnut in 1999. These are separate naming systems; a change in one does not automatically change another. [\[12,25,43\]](#)

Why are some names repeated?

They identify different source-specific definitions. Conversely, true same-value X11 aliases are combined within that dataset: ivory and ivory1 share one record, as do indian red and IndianRed. CSS remains separately attributed even when its value agrees with X11. [\[12,13\]](#)

Can the displayed codes be used to order paint?

Use the maker's product code and appropriate sample to specify paint. A hex code is a screen coordinate, not a paint mixing recipe. For a named material standard, use the relevant licensed or physical reference. The directory does not certify physical matches or current availability.

Why include conflicting records without a swatch?

A conflict is part of the evidence. The unresolved appendix preserves 37 dealer RGB/hex disagreements and PPG Iridescent Oyster MTL131, whose consulted page supplied no numeric swatch. None contributes to the 614-record total, and no arbitrary value is chosen.

Glossary

Term	Meaning
Alias	An alternate recorded name or spelling. An alias is combined only when the source identity and numerical value justify it.
Chroma	The strength or departure from a neutral appearance in a specified color model. It is related to, but not identical with, every definition of saturation.
Color space	A defined framework for interpreting color coordinates, such as sRGB.
Colour Index designation	An identifier used for colorants, such as PR101 or PB60. It identifies a pigment class or substance rather than one universal screen swatch.
Contrast ratio	The ratio derived from two relative luminances using the WCAG formula; it ranges from 1:1 to 21:1 for the opaque sRGB comparisons used here. [38]
Hex code	A base-16 expression of channel values; #RRGGBB is the six-digit form used here.
Hue	The attribute associated with distinctions such as red, yellow, green, and blue; neutral grays have no strong chromatic hue.
Indican	A sugar-linked indoxyl precursor investigated as an alternative route to forming indigo on textiles; distinct from reduced leuco-indigo. [24]
Leuco form	A chemically reduced form of a colorant, often less strongly colored; in conventional indigo dyeing it enables solubility in the alkaline bath. [23,24]
LRV	Light reflectance value: a source-reported material reflectance measure, distinct from screen-relative luminance.
Pigment	A colorant used as particles in a medium, rather than necessarily being dissolved in it. A pigment name does not fully specify binder, particle size, or resulting appearance.
RGB	Red, green, blue: an additive color-coordinate system. The directory uses eight-bit encoded channel values.
sRGB	A standardized RGB color space widely used for web content; the explicit standard for the CSS keywords in this article. [12,17]
Tint, shade, tone	In a common art convention, a tint is lightened with white, a shade darkened with black, and a tone modified with gray. Product naming may use these words more loosely. [39]
Vat dye	A dye applied through a chemical change to a soluble form and subsequently converted to an insoluble form in or on the textile; indigo is a major example. [23,24]

To go further

For screen color definitions, consult W3C CSS Color [\[12\]](#) and the ICC sRGB registry [\[17\]](#). For accessible text contrast, use the WCAG recommendation and its explanatory material [\[18,38\]](#). For materials, consult CAMEO [\[22,25,27,33,34\]](#) alongside specific manufacturer pigment declarations. For indigo research and historical evidence, see the directly consulted papers [\[23,24\]](#). For foundational color matching and visual context, read Feynman, Leighton, and Sands, chapter 35 [\[36\]](#), while recognizing the historical date of its physiological discussion.

How to update this article

Use the source URL, source code, and I-ID together. Verify a changed value at the primary source, check RGB/hex consistency, then review the rendered swatch and any affected family counts, figures, contrast ratios, and aliases. Retain an earlier value only if it has a dated source or a clearly identified historical context. The I-IDs belong to this edition and should not be treated as manufacturer identifiers.

References and source links

All cited pages, datasets, and supplied materials were consulted for this edition. Live-source access was checked on October 14, 2026. A publication date is given where established; undated pages are not assigned an invented year. Individual numeric rows link directly to their own evidence. The historical H reference is used only for structure and family policy. Inaccessible journal papers are not listed as directly consulted evidence; the editorial notes identify those limitations.
