Overview

What belongs on an L-colors page?

Lavender, lilac, lemon, lime, lapis, linen, and lampblack are familiar starting points. They lead into several different kinds of evidence: ordinary-language descriptions, historical naming systems, software keywords, material names, and commercial or institutional palettes. This edition brings together 1,620 source-specific digital records and 190 historical naming entries. It keeps those evidence types visible instead of treating every name as a universal color.

How to use this reference

Start with the explanations and worked comparisons, then use the alphabetical directory to find an exact name, issuer, and code. The companion atlas groups every admitted digital record into one of twelve GKBook shade families. The HTML directory supports name/source/code search and family filtering; CSV and JSON retain values and provenance for reuse. A source-specific record is the unit of counting: two issuers can use the same name for different previews.

The coverage boundary

The inventory is international and source-bounded. It includes the L subsets recovered from the named catalogs, a selected PPG page set, one regional Jotun inventory, a specified X.Org release, CSS keyword spellings, and qualified dealer and older-guide values. It is not a worldwide list of every color ever named. Historical entries are a separate lexical directory, not additional verified RGB colors. Do not add the two totals and call the result a count of unique colors.

A color name needs a source

Lavender is a useful test case

In ordinary English, lavender usually describes a pale purple; lilac covers a pale pink-to-purple range. Those broad descriptions help readers recognize a family, but they supply no unique digital coordinates. Flowers, fabrics, pigments, and paint samples also vary. A dictionary description and a catalog’s named preview answer different questions. [23, 24]

Four documented lavenders

The CSS keyword lavender is #E6E6FA, while Crayola’s Lavender preview is #FBAED2. Resene and the xkcd survey supply still other values. GKBook places the first in Violet and the Crayola swatch in Pink after visual review. Crayola’s own Purple category remains in the source-category field. The classification change does not alter the published numbers. [5, 13, 16, 17]

Identity includes more than the label

Use the issuer, named system or edition, identifying code, and source URL together. A Pantone TCX dealer approximation is not interchangeable with a TPG dealer approximation. A RAL screen preview is not the physical reference standard. A paint’s web RGB is not a pigment recipe, an assurance of current availability, or a measurement of the exact finish on a particular wall. [12, 14, 30]

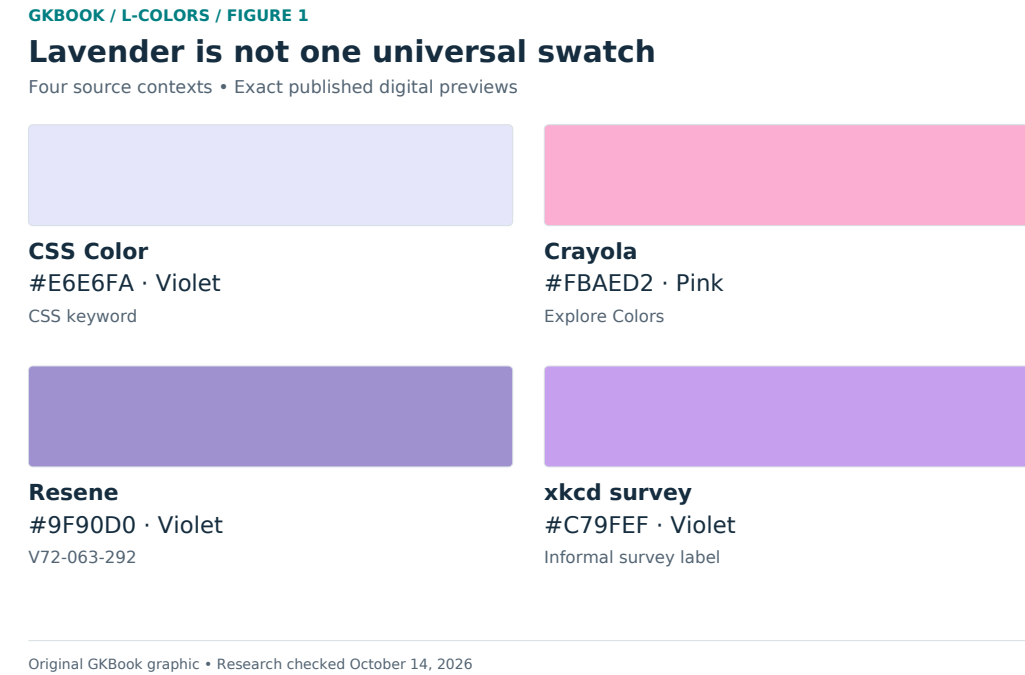

Figure 1. Lavender is not one universal swatch The label is shared; the cited values differ. Source category and GKBook family remain separate fields.

Reading RGB and hexadecimal values

Two notations for one digital triplet

An eight-bit RGB value gives each encoded channel an integer from 0 to 255. In #RRGGBB notation, each pair of hexadecimal digits represents one channel. For CSS lavender, E6 means $14 \times 16 + 6 = 230$, and FA means $15 \times 16 + 10 = 250$. Thus #E6E6FA and RGB (230, 230, 250) express exactly the same triplet. [17]

Specify the color space

Coordinates need an encoding context. The illustrations and contrast calculations here interpret the published eight-bit previews as sRGB. Where a paint source provides bare RGB or a CSS hex field without a measurement specification, this is a rendering convention for the edition, not an inferred laboratory characterization. Screen calibration, display gamut, output profiles, ink, paper, and illumination can change appearance. [19, 30]

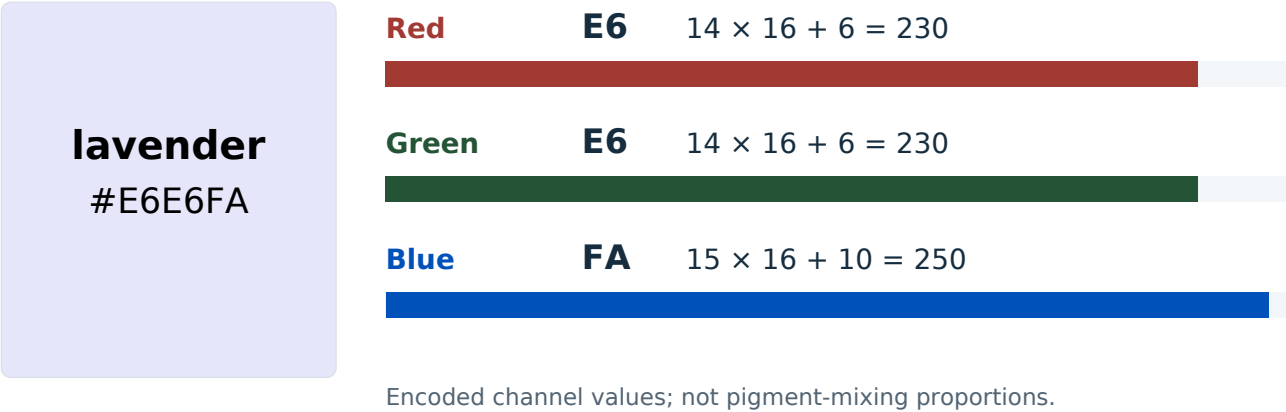

Do not mix unlike quantities

The channel numbers are not percentages of red, green, and blue paint. Encoded sRGB values are also not proportional to emitted light; the contrast calculation first converts them to linear-light components. Source LRV fields are copied as source metadata. They are not replaced by 100 times the luminance calculated from a web preview. [19, 20]

Light names, CSS, and X11

Light is often part of a proper name

The prefix creates a particularly large L vocabulary. Light Blue, Light Gray, Light Bronze Green, Light Gold, and Lighthearted Rose need not be generated by one common operation. The directory uses each issuer's published value. It does not manufacture missing shades by averaging a base value with white. The same rule applies to Dulux Half, Quarter, and Double names: each admitted strength has its own checked page. [7, 9, 10]

Keywords and lookup labels have different rules

The consulted CSS table has 22 L keyword spellings. Combining its two gray/grey alias pairs yields 20 directory records. X.Org rgb 1.1.1 contributes 85 L source rows; combining explicit spelling, spacing, and case aliases yields 62 records. Numbered X11 labels remain distinct, even when a numbered value happens to equal an unnumbered one. A label such as LightBlue1 is not thereby a CSS named keyword. [17, 18]

Lime is not a fruit measurement

CSS lime is the defined triplet #00FF00, and CSS limegreen is #32CD32. The xkcd survey's lime is #A AFF32. A lime peel or a paint named Lime can differ from all three. This is a useful distinction between a formally defined software token, an estimated informal naming label, and a physical referent. The source context determines which question a value answers. [13, 17, 29]

How GKBook assigns shade families

An editorial map of the swatches

The twelve families are navigation aids. Each admitted patch was inspected on a neutral background; hue, lightness, chroma, and neighboring appearances informed the final assignment. Automated preliminary bins helped organize the review, but visual judgment governed the result. The review log records the initial and final family for every entry. An exact repeated RGB preview receives the same final family throughout this edition.

Names do not dictate the result

Little Greene's Leather has a red preview, its Light Bronze Green looks brown, and Farrow & Ball's Light Blue is a muted gray. Crayola's Lavender appears pink. These are useful examples of why a name cannot serve as the classification algorithm. Source categories remain separate metadata and can reflect a maker's own merchandising or naming system. [7, 10, 16]

A particularly important source caveat

Nerolac's page headed Lime Green, code 02396, publishes a blue maincolor/color-circle CSS preview, #83B1DD. Both named main-swatch fields agree. This edition preserves that observed preview and assigns Blue, while flagging that the intended physical paint appearance has not been established. The label is not silently corrected and the value is not replaced with a more plausible green. [11]

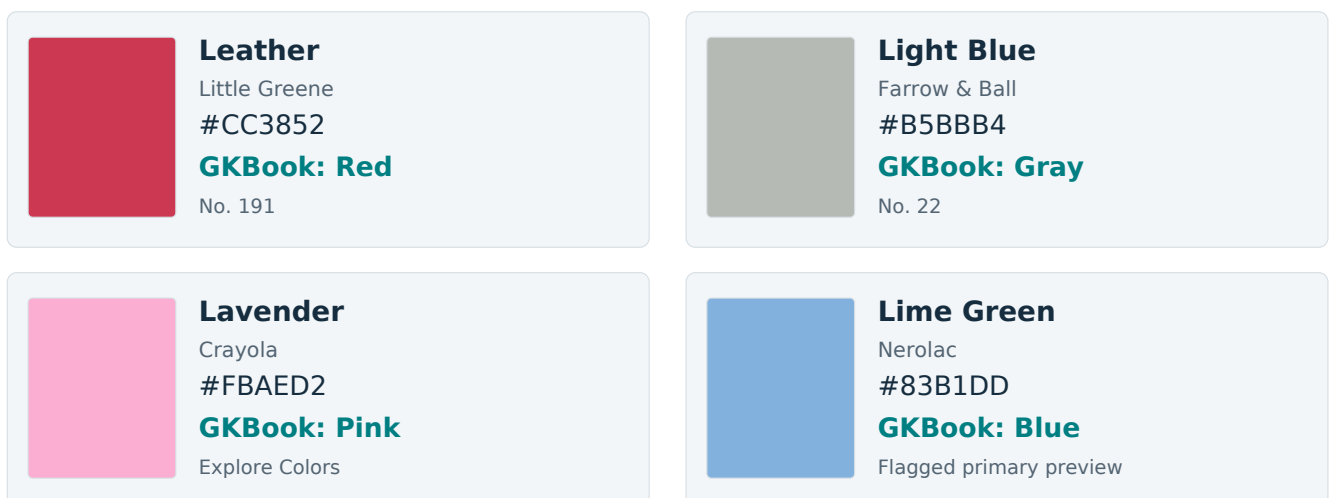

Boundaries are judgments, not new standards

Brown includes beiges and some ochres; White includes selected very pale tinted neutrals. Pink can include coral and muted rose. Purple and Violet are separated here by comparatively red/balanced versus blue-leaning appearance. Tinted grays and blue-green teals sit near several boundaries. Another careful editor might make a different boundary choice; the cited numerical record remains the same.

Figure 3. Read the swatch, keep the name Exact source values stay unchanged. Nerolac's Lime Green page publishes a blue main swatch; the directory flags that evidence boundary.

Materials and historical meanings

Lapis and lapis lazuli

Lapis lazuli is a rock aggregate with variable appearance, not a uniform digital paint chip. GIA describes blue material commonly accompanied by white calcite and metallic-looking pyrite. The proportions and distribution of components affect what a specimen looks like. A modern Lapis Lazuli paint name is therefore a separate catalog identity. The NBS directory even records the unmodified name Lapis in a moderate blue-green category, illustrating the limits of inferring a historical meaning from today's familiar object. [22, 26]

Lampblack and lamp black

CAMEO describes lampblack as a soot-derived carbon pigment historically made by burning materials such as oils or resins. Its physical appearance depends on the material and its use. NBS records Lamp Black in the broad black category; a modern paint called Lampblack can publish a visibly gray web preview. None of those facts establishes one universal lampblack hex code. [22, 27]

Lake is a pigment class as well as a color word

A lake pigment is made by depositing a dye onto an inorganic carrier. CAMEO lists several possible carriers and natural or synthetic dye sources. That production category does not specify a single hue. In historical naming, Lake can refer to red-related categories; in modern paint catalogs, lake-related names can suggest water blues or greens. The material term, historical headword, and modern trade name should be read in their own contexts. [22, 28]

Lilac and livid have histories, not just modern swatches

NBS preserves very different source assignments for Lilac, including two Maerz-and-Paul sample locators and a broad stamp-color range. Livid is cross-referenced to Lead in one historical source, while the related Livid Pink and Livid Violet entries occupy other categories. Cambridge also records a purple/dark-blue color sense of livid alongside its emotional sense. These are documented uses, not evidence that all sources intended the same shade. [22, 25]

What an NBS category number means

Kelly and Judd translated earlier color-name sources into ISCC-NBS descriptive regions. The serial number identifies a region such as light violet or grayish reddish brown. It is not an RGB code, a specimen identifier, or a recipe. Several numbers can describe a range or several source samples. This publication preserves those assignments without attaching invented centroid hex codes. The earlier books are consulted through the NBS compilation, not represented as independently examined originals. [22]

Readable color: a worked contrast example

A reproducible calculation

For each eight-bit channel c , divide by 255. Use $c/12.92$ when the normalized value is at most 0.04045; otherwise use $((c + 0.055)/1.055)^{2.4}$. Relative luminance is $0.2126R + 0.7152G + 0.0722B$ for those linearized values. The contrast ratio is $(\text{lighter luminance} + 0.05)/(\text{darker luminance} + 0.05)$. The supplied data include calculations against opaque black and white. [20]

Read the threshold correctly

WCAG AA calls for at least 4.5:1 for ordinary text and 3:1 for large text, with applicable exceptions. Large text means at least 18 points, or 14 points if bold. Compare the unrounded ratio with the threshold; rounding up does not turn a failure into a pass. The worked figure deliberately includes a poor white-text example to make the difference visible. [21]

A ratio is only one part of an accessible design

Use names and labels as well as colored patches. The atlas includes record identifiers and hex values; the HTML uses table headings, named controls, and a live result count. Contrast calculations describe the stated opaque color pair, not every image, transparency, hover state, or real-world background. The PDFs provide selectable text, links, and bookmarks; full PDF/UA conformance is not asserted.

Evidence quality and unresolved records

Check internal agreement before choosing a swatch

Eighty-five Pantone TPG dealer rows have RGB values that do not encode to their stated hex. Resene La Rioja publishes the malformed five-digit string #BAC0E alongside RGB (186, 192, 14). Liberty Red in Liberty's Fall 2024 guide gives #B72025 but RGB (183, 13, 29), which encodes to #B70D1D. All 87 rows are held outside the verified digital directory and atlas. Their original fields and source URLs remain available for inspection. [\[5, 12, 31\]](#)

An internally consistent approximation is still an approximation

The admitted TCX and TPG dealer rows remain explicitly labeled dealer approximations. Their arithmetic consistency does not authenticate a current licensed Pantone standard. The two COLORSTEEL records are likewise attributed as supplier previews hosted by Resene. These evidence types are visible in the directory, graphics, and data. [\[5, 12\]](#)

Version differences deserve their own labels

Eleven Sherwin-Williams records use an older manufacturer table because a current numerical record was not established in this research pass. Four LSU values are specifically from Brand Guide v3.2, whose secondary palette differs from the current web book. The edition does not infer updated numbers by sampling palette images. A difference between web values does not, by itself, prove a change in physical pigment or product formulation. [\[32–35\]](#)

Do not resolve one context with another

Liberty's separate web policy specifies a web red of #990000. That does not decide which of the conflicting general-guide Red fields was intended. Similarly, a current product name, a historical table, a dealer's conversion, and a regional catalog cannot be substituted without documenting the change of evidence. [\[31, 36\]](#)

Source coverage and family guide

Source groups identify distinct evidence contexts. They are not a count of unrelated manufacturers. TCX/TPG dealer previews, the two Sherwin-Williams table contexts, and the version-specific LSU guide are deliberately distinguishable. Counts below are after documented alias consolidation.

Aliases and source versions

The 27 combined source rows comprise 23 X11 case/spacing/gray-grey aliases, two CSS gray-grey aliases, and two same-code Nerolac pairs. The Nerolac pairs are Laser Gray/Grey and Little Seeding/Seedling. Numbered X11 labels remain separate; identical hex alone is not a reason to merge names or sources. [11, 17, 18]

The source-version JSON preserves 50 code-matched differences between the older Sherwin-Williams table and the retained general-table/current-page previews. Eleven older-only identities remain explicitly qualified. These observations establish differences in published digital evidence, not a physical reformulation. [3, 34]

Historical L-color names

The 190 entries below are transcribed from the scanned principal L block on printed pages 121–124 (PDF pages 157–160) of NBS SP 440. They include L-initial modified forms printed within that block. Inverted index pointers such as “Lake, Rose” are not separate L headwords. Modified names beginning with another letter are excluded. This is not a search for every “Light ...” entry filed elsewhere under its base name in the entire dictionary. [22]

Key	Earlier source interpreted by NBS
B	H. A. Dade, Color Terminology in Biology.
F	Federal Specification TT-C-595, Colors; (for) Ready-Mixed Paints.
H	R. F. Wilson, Horticultural Colour Charts.
M	Maerz and Paul, A Dictionary of Color, first edition.
P	Plochere Color System.
R	Ridgway, Color Standards and Color Nomenclature.
S	William H. Beck, Postage-Stamp Color Names.
T	Taylor, Knoche, and Granville, Descriptive Color Names Dictionary.
TC	Textile Color Card Association: Standard Color Card of America and U.S. Army Color Card.

Source keys with parentheses preserve sample locators. Each source assignment is expanded separately; a category region is not a unique RGB triplet. Bracketed and unbracketed forms of Lemon [Yellow], Lime [Yellow], and Lobelia [Blue] are grouped where the same lexical name is involved. The F-qualified Loam (Eng 7) remains distinct from unqualified Loam.

Unresolved numerical evidence

87 source rows are held. The table preserves the published hex and RGB; the final column is the exact hex calculated from that RGB, not an editorial correction. La Rioja is malformed; the other rows contain conflicting numerical fields. None receives a verified digital swatch in this edition.

Name-only evidence and scope gaps

Name / source	Evidence boundary
Lake Blue / LSU current web Brand Book	Name verified in the current primary palette image. No numerical specification admitted; pixels were not sampled.

LSU’s current Lake Blue name appears in its palette image, but no numerical field was recovered. The image was not sampled to manufacture a specification. Dulux Legacy and Nerolac Lilac are editorial collection/topic pages; they are not counted as individual paint products. PPG coverage is a selected page set. Jotun coverage is complete only for the consulted 989-record regional inventory. [\[6, 9, 11, 15, 33\]](#)

Glossary

Term	Meaning
Color name	A linguistic label; it may be broad, source-specific, historical, or formally defined.
Source-specific record	One naming identity within a stated issuer/system/version and its published preview.
Hexadecimal	Base-16 notation; #RRGGBB expresses three eight-bit channels.
sRGB	The RGB encoding used to render this edition’s digital previews.
RGB / LRV	RGB describes encoded digital channels. Source LRV describes a different reported light-reflectance quantity.
Shade family	GKBook’s editorial visual grouping, separate from the issuer’s category.
Alias	A documented spelling/case/spacing alternative combined with one retained source record.
Dealer approximation	A third-party numerical preview; not a verified licensed physical standard.
Historical category	An ISCC-NBS descriptive region, identified by a serial number; no hex is implied.
Relative luminance	A calculated light-related quantity from linearized sRGB channels.
Contrast ratio	The luminance ratio with 0.05 offsets used for the stated text/background pair.
Held record	A source record excluded from the digital atlas because its numerical fields are unresolved.

Frequently asked questions

What are some colors that start with L?

Common examples include lavender, lilac, lemon, lime, lapis blue, linen, and lampblack. Use the source-linked directory when you need an exact digital value; the ordinary name alone may not determine one.

Are lavender and lilac the same?

They overlap in ordinary language, but their definitions and source-specific values differ. This edition preserves the name, issuer, code, and preview instead of collapsing them into one color. [23, 24]

Why is a color with “green” in its name sometimes blue, yellow, or brown?

A proper name can survive despite differences in the source preview, system, or context. GKBook classifies the visible patch and preserves the name. The Nerolac Lime Green page is explicitly flagged because its named main preview is blue.

How many L colors are there?

This edition admits 1,620 digital records after its documented alias consolidations. That is a count within the consulted sources, not a universal total. The 190 historical entries are a separate lexical inventory.

Can I use the hex values to order paint?

Use the source’s product name, code, market, finish, and current physical sample for specification. A digital preview is useful for identification and screen illustration; it is not a substitute for the issuer’s physical reference.

Why are the historical names missing swatches?

NBS category regions and old sample references do not establish unique modern RGB triplets. Leaving those fields absent preserves what the evidence actually supports.

Are the illustrations reusable?

The layouts, labels, and explanatory graphics are original work. The bundle supplies SVG/PNG originals and factual source attribution. It does not grant rights in third-party marks, images, proprietary standards, or physical swatch collections.

Is the page already online?

The delivered HTML is an offline publication file. No live website has been changed or published.
